THE ENERGY ISSUE / DATA DESK / NO. 08

The Great Green Switch

In ten years renewables went from a quarter of the world's electricity to more than a third. Solar and wind did most of the lifting, while hydropower quietly kept the lights on. Here is who moved, how fast, and what the grid looks like now.

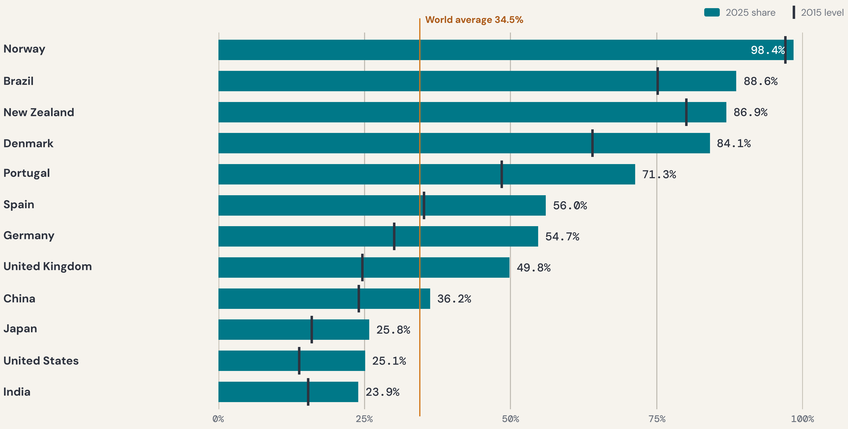
34.5%
of global electricity came from renewables in 2025

+11.2 pts
rise in the renewable share since 2015

6.8×
growth in solar generation over the decade

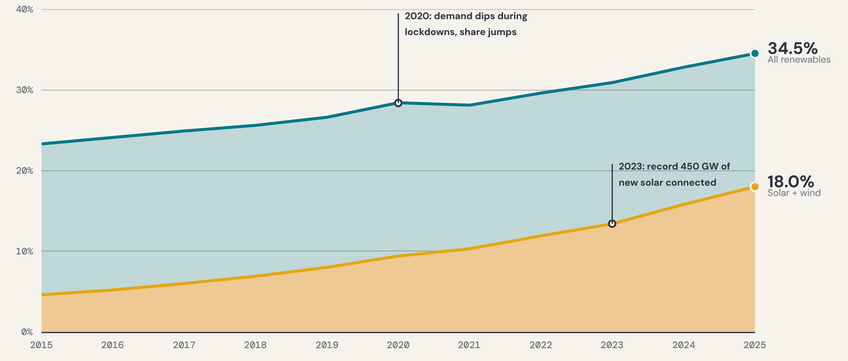
01 Who's leading the switch

Renewable share of electricity generation, 2025, with the 2015 level marked



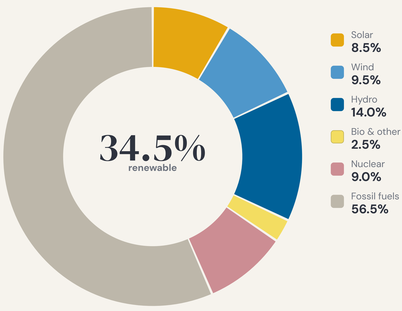
02 A decade of steady climbing

World: renewable share of electricity, and the part from solar and wind



03 Today's power mix

World electricity mix, 2025



04 Every hundred homes

Each house = 1% of 2025 generation

35 of 100 houses run on renewables; 56 still burn coal, gas or oil.

* Illustrative dataset created for a Vixl layout exploration; values are invented and must not be cited. Shares are of electricity generation, not total energy.

Method: shares of annual generation (TWh). Isotype rounded with the largest-remainder method.
